4-and 5-Alkynyloxindoles and 4-and 5-Alkenyloxindoles

5

The present invention is directed to novel 4- and 5-alkynyloxindoles as well as 4- and 5-alkenyloxindoles which inhibit or modulate protein kinases, in particular JNK protein kinases. These compounds and their pharmaceutically acceptable salts, and prodrugs of said compounds, are useful as anti-inflammatory agents, particularly useful in the treatment of rheumatoid arthritis. The invention is also directed to pharmaceutical compositions containing such compounds, and to methods for the treatment and/or control of inflammation, particularly in the treatment or control of rheumatoid arthritis. This invention is further directed to intermediates useful in the preparation of the foregoing compounds.

15

Protein kinases are a class of proteins that regulate a variety of cellular functions. This is accomplished by the phosphorylation of specific amino acids on protein substrates resulting in conformational alteration of the substrate protein. The conformational change modulates the activity of the substrate or its ability to interact with other binding partners. The enzyme activity of the protein kinase refers to the rate at which the kinase adds phosphate groups to a substrate. It can be measured, for example, by determining the amount of a substrate that is converted to a product as a function of time. Phosphorylation of a substrate occurs at the active-site of a protein kinase.

25

The JNK (Jun N-terminal kinase) protein kinases (also know as "stress-activated protein kinases" or "SAPK") are members of the mitogen-activated protein (MAP) kinases. See, e.g., S. Gupta et al., EMBO J., vol. 15 no. 11 (1996) pp. 2760-2770; and Yang et al., Nature, vol. 289 (23 October 1997) pp. 865-870. At least ten JNK isoforms are currently known. See, Gupta, *id.* As its name indicates, one of the substrates for JNK is c-Jun. JNK phosphorylates the NH<sub>2</sub>-terminal activation domain of c-Jun on Ser63 and Ser73, causing increased c-Jun transcriptional activity. See Gupta, *id.* In turn, c-Jun is an AP-1 transcription factor that mediates immediate-early gene expression. See, e.g., A. Minden et al.,

30

Biochimica et Biophysica Acta 1333 (1997) F85-F104; and P. Agel et. al.,  
Biochimica et Biophysica Acta, vol.1072 (1991) pp.129-157.

The JNK protein kinase is markedly activated in response to treatment of  
5 cells with pro-inflammatory cytokines or exposure to environmental stress. JNK  
thus mediates the effect of extracellular stimuli on c-Jun. See Gupta, *supra*; and  
Minden, *supra*. Accordingly, JNK is a physiological regulator of AP-1  
transcriptional activity. Thus, inhibition of JNK activity will inhibit AP-1-dependent  
10 transcription of inflammatory and immune mediators which are implicated in  
pathological proliferative conditions, for example inflammatory diseases and  
neuro-degenerative diseases, in particular, rheumatoid arthritis. See, eg. Swantek  
et al., Molecular and Cellular Biology, vol. 17 (1997) pp. 6274-6282; Maroney et  
al., J. Neuroscience, vol. 18 (1 Jan. 1998) pp. 104-111 ; and Minden, *supra*, at  
F92.

15

The rat homologue of JNK is also called SAPK (stress-activated protein  
kinase). SAPK isoforms share significant (>90%) sequence identity with the  
corresponding JNK isoforms [*compare* Kyriakis et al., Nature, Vol 369 (12 May  
1994) pp. 156-160 and Gupta et al., *supra*]. Both JNK and SAPK are capable of  
20 phosphorylation of the c-Jun substrate and thus have very similar enzyme activity.  
JNK and SAPK are part of a protein kinase cascade that is activated by various  
extracellular stimuli. See e.g. Minden *supra*; and Kyriakis et al., BioEssays Vol 18  
(1996) pp. 567-577. JNK and SAPK each can be activated by phosphorylation on  
specific threonine and tyrosine residues by dual specificity MAP kinase kinases  
25 such as MKK4, SEK-1, or MKK7. See Kyriakis et al., *supra*; and Tournier et al.,  
Proceedings of the National Academy of Sciences USA Vol. 94 (July 1997), pp.  
7337-7342. The dual specificity MAP kinase kinases can be activated by  
phosphorylation on serine and/or threonine residues by MAP kinase kinase  
kinases such as MEKK-1. Thus, measurement of JNK or SAPK enzyme activity  
30 may be enhanced by activation by the upstream or preceding kinases. Moreover,  
measurement of SAPK inhibition is closely correlated with JNK inhibition.

Inhibitors of protein kinase catalytic activity are known in the art. See WO  
98/24432 (indoline compounds that inhibit FLK protein kinase); WO 97/45409

(substituted tetralylmethylene-oxindole analogues that inhibit tyrosine kinase). In particular, small molecule inhibitors typically block the binding of substrates by tightly interacting with the protein kinase ATP binding site (or "active site"). See WO 98/24432. It is desirable to identify small-molecule compounds that may be readily synthesized and are effective in inhibiting the catalytic activity of protein kinases, in particular of the JNK protein kinases.

Indolinone (also known as oxindole) compounds asserted to be useful in regulating abnormal cell proliferation through tyrosine kinase inhibition are disclosed for example in WO 96/40116, WO 98/07695, WO 95/01349, WO 96/32380, WO 96/22976, WO 96/16964 and WO 98/50356 (2-indolinone derivatives as modulators of protein kinase activity); Mohammadi et. al, Science, Vol. 276, 9 May 1997, pp. 955-960. Oxindole derivatives have also been described for various other therapeutic uses: 5,206,261 (improvement of cerebral function); WO 92/07830 (peptide antagonists); EP 580 502 A1 (antioxidants).

There continues to be a need for easily synthesized, small molecule compounds effective in inhibiting JNK protein kinase and thus useful in the treatment or control of pathological proliferative conditions, for example inflammatory diseases and neuro-degenerative diseases, in particular, rheumatoid arthritis. It is thus an object of this invention to provide such compounds and compositions containing such compounds.

5

"Effective Amount" means an amount of at least one compound of formula I and/or II, or a pharmaceutically acceptable salt, prodrug or metabolite thereof, that inhibits the development or proliferation of (1) an inflammatory disease or response and/or (2) a neuro-degenerative disease or response, such as for  
10 example, and not as a limitation, rheumatoid arthritis.

"Halogen" means fluorine, chlorine, bromine or iodine.

"Heteroaryl" groups are aromatic groups having 5 to 10 atoms, one or 2  
15 rings, and containing one or more hetero atoms. Examples of heteroaryl groups are 2-, 3- or 4-pyridyl, tetrazolyl, oxadiazolyl, pyrazinyl and quinolyl.

"Hetero atom" means an atom selected from N, O and S.

"Heterocycle" means a 3- to 10-membered non-aromatic, partially or completely saturated hydrocarbon group, such as tetrahydroquinolyl, which  
25 contains one or two rings and at least one hetero atom.

"IC<sub>50</sub>" refers to the concentration of a particular 4- or 5-alkynyloxindole or 4- or 5-alkenyloxindole required to inhibit 50% of cJun phosphorylation, which is a measure of inhibition of SAPK activity. IC<sub>50</sub> can be measured, *inter alia*, using the  
30 assay described herein in Example 102.

"Lower Alkyl" denotes a straight-chain or branched saturated aliphatic hydrocarbon having 1 to 6, preferably 1 to 4, carbon atoms. Typical lower alkyl

25 88%; b.p. 86 - 90 °C, 0.15 mm Hg).

**Step B:** Sodium hydride (11.80 g, 50% in oil) was washed with petroleum ether twice to remove oil. Hexamethylphosphorimide (HMPA) (100 mL) (Aldrich) was added to this washed sodium hydride under an argon atmosphere. The resulting

mixture was stirred magnetically and cooled in an ice/water bath. Methyl 4-chlorosalicylate (37.32 g) (from Step A above) in HMPA (50 mL) was added dropwise and the mixture stirred for an additional 10 min. **Example 102: SAPK Inhibitory Activity**

The SAPK inhibitory activity of the compounds of the invention is demonstrated below. These effects indicate that the compounds of the present invention are useful in treating inflammatory diseases such as, for example, rheumatoid arthritis.

**SAPK FlashPlate Assay**

Human JNK is highly homologous to rat SAPK. To measure the inhibitory activity of test compounds, the compounds were tested in the rat SAPK assay.

For the SAPK assay, purified GST-cJun (a chimeric protein containing cJun, a natural substrate of JNK) was coated on 96 well FlashPlates (New England Nuclear, Boston, MA). Purified rat SAPK (isoform  $\beta$ , Kyriakis et al. *supra*) was preincubated with preparations containing MEKK-1 and MKK4 for 30 minutes at 37°C in assay buffer containing 25 mM HEPES, pH 7.5, 150 mM NaCl,

20 mM MgCl<sub>2</sub>, 2 mM DTT, 0.001% Tween 20, 1 μM ATP freshly added. In the preincubation step, MEKK-1 phosphorylates and activates MKK-4, which in turn phosphorylates and activates SAPK. The activated SAPK was then added to the cJun coated FlashPlates along with <sup>33</sup>P-ATP (0.32 μCi per reaction) and test compounds. The plates were incubated for 30 minutes at 37°C, then washed with PBS, 0.01% Tween 20, and counted in the Topcount scintillation counter (Packard Instrument Co., Downers Grove, IL). Dilutions of compounds were tested in duplicate in each assay. The percent inhibition of cJun phosphorylation (a measure of inhibition of SAPK activity) was determined by the following formula:

$$100 \times \left[ 1 - \frac{\text{test compound} - \text{nonspecific}}{\text{total} - \text{nonspecific}} \right]$$

where "test compound" refers to the average counts per minute of the test duplicates, "nonspecific" refers to the average counts per minute when no SAPK was added, and "total" refers to the average counts per minute when no compound was added.

The results of the SAPK assay with various test compounds is summarized below in Table I A and I B.

**MG-63 Cell-Based Assay**

The MG63 cell line, a human osteosarcoma cell line, was purchased from American Type Culture Collection (ATCC; Rockville, MD) and grown in the medium recommended by ATCC. When stimulated with human IL-1 $\beta$ , MG63 cells release matrix metalloproteinase 3 (MMP-3), an AP-1 dependent inflammatory mediator and IL-6, a NF- $\kappa$ B-dependent mediator. In this assay the ability of a test compound to block MMP-3 expression and not block IL-6 expression is an indication that the compound is a selective inhibitor of the AP-1 transcription pathway.

15

On day 1 the cells were plated at  $2.5 \times 10^4$  cells/well in 96 well plates. After 24 hours, dexamethasone (the assay control) (Sigma, St. Louis, MO) and the test

compounds were diluted to appropriate concentrations and added to the MG63 cells. The cells were incubated with the compounds for 24 hours after which the supernatants were removed and analyzed by ELISA.

5 In the ELISA, 96 well plates were coated with antibody to MMP-3 or IL-6. Supernatants were added to the coated plates and any antigen (MMP-3 or IL-6) in the supernatant bound to the antibody coated on the plates. The plates were then washed with PBS containing 0.05% Tween 20 (Sigma, St. Louis, MO) and the biotinylated secondary antibody was added. This secondary antibody binds to the  
10 already bound antigen creating a "sandwich effect". Plates were washed as described above and horseradish peroxidase (HRP)-streptavidin conjugate (Sigma, St. Louis, MO) was added to the plates. HRP-streptavidin bound to the biotin-antibody conjugate. The plates were washed and TMB substrate  
15 substrate changes color in the presence of HRP-streptavidin. The intensity of the color (measured at 450 nm) is proportional to the amount of MMP-3 or IL-6 produced by the MG63 cells upon exposure to IL-1 $\beta$  and the test compounds. Optical density values were converted to concentration (pg/ml or Units/ml) based on a standard curve included in the assay. IC<sub>50</sub> values for each test compound  
20 were determined from the linear regression of a plot of the logarithm of the concentration of compound versus amount of MMP-3 or IL-6 secreted. (The MMP-3 antibodies were prepared in-house using standard hybridoma technology and the IL-6 antibodies were obtained from either Genzyme, Cambridge, MA or Pharmingen, San Diego, CA.).

### **U937 Cell-Based Assay**

The U937 cells, a human monocyte/macrophage cell line, was obtained from the ATTC and grown in the recommended medium. These cells when  
5 stimulated with lipopolysaccharide (LPS) release TNF, another inflammatory mediator implicated in the JNK pathway (Swantek et al., *supra*) and IL-6. In this assay the ability of a test compound to block TNF expression is evaluated.

The assay is very similar to the MG63 cell based assay except for the  
10 following modifications. The U937 cells were suspension cells but when stimulated with phorbol myristate acetate (PMA) (Sigma, St. Louis, MO) they become adherent. After PMA stimulation the cells were washed in cell culture medium and plated at  $1 \times 10^5$  cells/well in 96 well plates. The following day the test compounds and dexamethasone control (Sigma, St. Louis, MO) were added to the cells for 1  
15 hour of preincubation. Then the cells were stimulated with LPS (Sigma, St. Louis, MO). After an additional 24 hours of incubation the supernatants were removed and assayed for TNF- $\alpha$  and IL-6 by ELISA. The IL-6 ELISA was run as described previously for the MG63 assay. The TNF ELISA was run using a kit supplied by  
20 Genzyme (Cambridge, MA).

The results of this assay with various test compounds is summarized below in Table III.
